Navicula cuspidata forma genuina Hustedt, 1961, Die Kieselalgen Deutschlands, Osterreichs, und der Schweiz, pt. 3, p. 59-64, fig. 1206a. Description.--Valve lanceolate with small attenuated rounded apices; axial area narrow, expanding only slightly at central area; striae fine, 13 or more in 10/, parallel; longitudinal rows of puncta can be seen only at high magnification. Remarks.--The valves of this species are very thin and fragile and only broken specimens were observed. The differences between N. cuspidata and N. halophila as described in the literature are not striking, and the Kilgore specimens could possibly be assigned to N. halophila. The coarseness of the striae has, however, suggested that they be placed in N. cuspidata. This species is rare in USGS diatom localities 5836 and 5837. Living representatives of the species are widespread in many fresh-water environments. Known geologic range.--Late Miocene to present.
